ABSTRACT:

PROBLEM TO BE SOLVED: To provide a sales promotion supporting method which notifies a supplier of sales promotion contents of the effects of the sales promotion contents when the sales promotion contents such as catalogs and so on which a user wants are printed with a printer installed in a shop.

SOLUTION: Printing data are generated in a transmission server 16 based on the electronic data of the sales promotion contents stored in a data server 5. At that time, an identifier for monitoring information on the purchasing behavior of a user of articles is added to the printing data. The transmission server 16 transmits the printing data to a printer 3. When the user buys the articles by the use of the printed matters, a printed matter use information input terminal 6 installed in the shop reads the identifier printed in the printed matter and notifies a management server 7 of the results of the reading. The fare computing section 60 of the management server 7 adjusts the ratio of burdens on the supplier for a fee charged for outputting the printed matter based on the use state shown by the identifier, and provides the supplier with the information on the user's purchasing behavior.

ABSTRACT:

CHG DATE=20030403 STATUS=O>A system employs a code reading wand or digital pen to order items from a catalog employing item-identifying indicia which are preferably position-indicating indicia. The catalog includes items provided by plural suppliers. Single catalog order may be issued and distributed to plural suppliers by access to supplier information in a database. The catalog may be distributed with the code reading wand to promote initial use of the code reading wand and thereby aid in establishment of the technological infrastructure through immediate use of the wand. The catalog may include additional services to encourage the use of the catalog, thereby increasing catalog orders. The catalog service may be funded by charging suppliers a per order or inquiry, periodic fee, based upon orders placed.

TITLE: Providing collaborative installation management in a network-based supply chain environment

DATE-ISSUED: August 12, 2003

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Mikurak; Michael G.	Hamilton	NJ		

US-CL-CURRENT: 717/174; 705/26, 717/178

ABSTRACT:

A system, method and article of manufacture are provided for collaborative installation management in a network-based supply chain environment. According to an embodiment of the invention, telephone calls, data and other multimedia information are routed through a network system which includes transfer of information across the internet utilizing telephony routing information and internet protocol address information. The system includes integrated Internet Protocol (IP) telephony services allowing a user of a web application to communicate in an audio fashion in-band without having to pick up another telephone. Users can click a button and go to a call center through the network using IP telephony. The system invokes an IP telephony session simultaneously with the data session, and uses an active directory lookup whenever a user uses the system. Users include service providers and manufacturers utilizing the network-based supply chain environment.

File: USPT

Aug 1, 1995

US-PAT-NO: 5438508

DOCUMENT-IDENTIFIER: US 5438508 A

TITLE: License document interchange format for license management system

DATE-ISSUED: August 1, 1995

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Wyman; Robert M.	Kirkland	WA		

US-CL-CURRENT: 705/8; 705/26, 705/59

ABSTRACT:

A distributed computer system employs a license management system to account for software product usage. A management policy having a variety of alternative styles and contexts is provided. Each licensed product upon start-up makes a call to a license server to check on whether usage is permitted, and the license server checks a database of the licenses, called product use authorizations, that it administers. If the particular use requested is permitted, a grant is returned to the requesting user node. The product use authorization is structured to define a license management policy allowing a variety of license alternatives by values called "style", "context", "duration" and "usage requirements determination method". The license administration may be delegated by the license server to a subsection of the organization, by creating another license management facility duplicating the main facility. The license server must receive a license document (a product use authorization) from an issuer of licenses, where a license document generator is provided. A mechanism is provided for one user node to make a call to use a software product located on another user node; this is referred to as a "calling card", by which a user node obtains permission to make a procedure call to use a program on another node. A management interface allows a license manager at a server to modify the license documents in the database maintained by the server, within the restraints imposed by the license, to make delegations, assignments, etc. The license documents are maintained in a standard format referred to as a license document interchange format so the management system is portable and can be used by all adhering software vendors. A feature of the database management is the use of a filter function.

US-PAT-NO: 6763334

DOCUMENT-IDENTIFIER: US 6763334 B1

TITLE: System and method of arranging delivery of advertisements over a network
such as the internet

DATE-ISSUED: July 13, 2004

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Matsumoto; Takuya	Toyonaka			JP
Kidera; Shiro	Ebina			JP
Ishii; Ryuichi	Yokohama			JP

US-CL-CURRENT: [705/14](#); [705/26](#), [705/27](#), [709/217](#)

ABSTRACT:

A method and system of arranging advertisements on a network for a potential media owner or affiliate to sell ad space on a network media to an advertiser. The advertiser's conditions and the affiliate's acceptance are made on the network through an agent's server. The server provides an invitation page for entry of the advertiser's conditions. The conditions are disclosed to the affiliate on the network. When the affiliate accepts the conditions on the network, the agent's server responds to make an advertisement contract, and allocates an advertiser's web site to the ad space of the network media. The number of the responses made to the advertisement is counted at the agent's server, which delivers statistical data of the counted responses on the network to the advertiser and the affiliate for determination of the payment and for evaluation of the effectiveness of the advertisement.

Arai; Toshiyuki	Tokyo			JP

US-CL-CURRENT: 705/52; 705/27, 707/10, 709/217, 709/219

ABSTRACT:

An efficient as well as rational information distribution system where retrieval can be carried out based on various kinds of retrieval information related to download information and particularly, at a time when the download information is specified from the retrieval information, if the retrieval information is outputted to a user as an advertisement, the amount of money to be billed for the download information is reduced by what the advertisement is worth.
